

Taridium adds visual voicemail to ipbx enterprise PBX solution

Lewes, Delaware, - April 2, 2007 – Taridium, the next generation VoIP solutions provider, today announced the addition of the ipbx mobile interface to its enterprise PBX solution.

With the ipbx mobile interface your employees always stay ahead of the game. Visual voicemail allows them to listen to voicemail directly from their mobile phone browser. They can check their missed calls and call users back as if they were at their desk. A company directory allows quick access to colleagues via automated callback. This does not only save money, but also allows access to the Taridium unified voicemail system, where a single mailbox serves VoIP phones, mobile phones and any other phone that supports conditional call diversion. And if required for compliance reasons, all calls passed through the mobile phone can be recorded.

“One of the big advantages of the Taridium ipbx mobile interface is that users can access internal PBX extensions directly from their mobile phone with a single click – it basically allows you to take your office extension with you” says Dominique Kull, Taridium’s CTO.

The Taridium ipbx mobile interface comes standard with all ipbx installs and is compatible with mobile phones that support a WAP 2.0 browser.
